SUMMARY

I am Go developer with experience in PHP and Python. I have **3 years of experience** and transitioned into programming from the advertising industry due to regularly solving tasks related to writing code. During my time in advertising, I implemented various tools, including web scrapers, traffic distribution systems (TDS), autobidders, and automated solutions for A/B testing.

HARD SKILLS

Go — | PostgreSQL | gRPC | Docker | Python | Kafka

EXPERIENCE

Backend engineer 01/2024 – present | Limassol, Cyprus

Indrive

- Optimize the high-volume data storage and reporting process
- Modify the use of queues
- Develop tools to save costs for external APIs
- Develop solutions for the 60+ countries where the app is used
- Participate in system design and architectural solution development together with the team (sahrding, geodistribution of balance services)
- Improve SLI of owned services
- Write integration and unit tests, develop automation tools for everyday tasks

Go Developer 10/2023 – 01/2024 | Moscow

Wildberries 🔗

Developing microservices, data synchronization and APIs for OLAP & Warehouse

Backend Developer 03/2022 – 07/2023 | Saint-Petersburg

ViceCode

Design and development of an internal platform for company employees.

My implementations include:

- Web scraping and API integration with advertising platforms
- Summary reports, dashboards
- Budget management, RTB
- PMS
- Employee KPI calculation system
- Alerts
- Report exports

Actively participated in the design of the internal platform, focusing not only on technical implementation but also on adding functionality based on the company's internal needs. Direct communication with the business.

SM Holding

My primary responsibilities involved developing integrations to introduce our software to external platforms and providing ongoing support for these integrations. This included collaborating with the customer's technical team and offering assistance.

In this role, I focused on implementing reverse integrations capable of efficiently handling various operations such as processing transactions, managing player balances, and handling special cases like reverting cash transactions. Each integration was developed as a standalone microservice.
